

# BlueBridge ServerAnalyzer

Analyze server issues, view installed features and compare servers

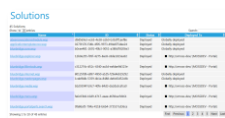

It is easy to manage a single SharePoint server out of the box. As soon as you start adding third-party solutions or working with complex multi-server farms, though, it becomes very difficult to manage the platform and diagnose problems. BlueBridge ServerAnalyzer for Microsoft SharePoint allows you to quickly view the status of the server and compare this to other servers within your farm.

## Scan Your Server (Free!)

Simply run the .exe program directly on the server and the software will automatically generate a server report, showing farm solutions, timer jobs and feature definitions, as well as a copy of the web.configs (per web application) and a list of the GAC content. No installation required!

## View and Document Results (Free!)

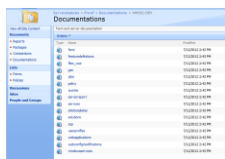

With the free Documenter tool, it's simple to view the results of the server analysis and to get to the information you need quickly. Click through the criteria you want to analyze, and the results will be displayed in a simple, clear layout. Run the Documenter on any machine to help you give remote support without needing to log on to the server. No installation required!

## Comparing Servers (Consultant Edition)

Upgrade to the Consultant Edition of BlueBridge ServerAnalyzer to compare existing servers with each other. This is useful for spotting discrepancies such as software that was installed on one server but not another, and can therefore be useful for improving performance and diagnosing error sources, or as an aid to migration. No installation required!

## Fully Automated Process (Enterprise Edition)

If you start to notice performance issues on your server, it might be worth checking which jobs are running on your server which weren't there 6 weeks ago. BlueBridge ServerAnalyzer Enterprise Edition makes this process easy, saving server reports automatically at regular intervals and allowing you to view and compare results.

## Technical Information

- Compatibility: SharePoint 2007, 2010 and 2013; all versions
- Compliance: BlueBridge ServerAnalyzer uses Microsoft-approved web services
- Language: All SharePoint languages are supported; interface is in English
- Installation: No installation required for LITE and Consultant Editions; the Enterprise Edition is provided as a WSP and can be installed easily on your SharePoint server

## Use Cases

## Report Contents

Each report will provide you with valuable information about your servers and their configuration, such as:

- Solutions
- Features
- Service applications
- Services
- Timer jobs
- Farm settings (e.g. quotas, mail)
- Search settings
- Assemblies
- Directory listing of web server extensions
- Web application settings
- Web.configs for each web application
